

Installation of Hadoop 2.6.3 on Ubuntu

Installing Java

Hadoop framework is written in Java!!

```
rashmi@laptop:~$ cd ~  
  
# Update the source list  
rashmi@laptop:~$ sudo apt-get update  
  
# The OpenJDK project is the default version of Java  
# that is provided from a supported Ubuntu repository.  
  
rashmi@laptop:~$ sudo apt-get install openjdk-7-jdk  
  
rashmi@laptop:~$ java -version  
java version "1.7.0_91"  
OpenJDK Runtime Environment (IcedTea 2.5.3) (7u71-2.5.3-0ubuntu0.14.04.1)  
OpenJDK 64-Bit Server VM (build 24.65-b04, mixed mode)
```

Adding a dedicated Hadoop user

```
rashmi@laptop:~$ sudo addgroup hadoop  
Adding group `hadoop' (GID 1002) ...  
Done.  
  
rashmi@laptop:~$ sudo adduser --ingroup hadoop hduser  
Adding user `hduser' ...  
Adding new user `hduser' (1001) with group `hadoop' ...  
Creating home directory `/home/hduser' ...  
Copying files from `/etc/skel' ...  
Enter new UNIX password:  
Retype new UNIX password:  
passwd: password updated successfully  
Changing the user information for hduser  
Enter the new value, or press ENTER for the default  
    Full Name []:  
    Room Number []:  
    Work Phone []:  
    Home Phone []:  
    Other []:  
Is the information correct? [Y/n] y
```

Installing SSH

ssh has two main components:

1. **ssh** : The command we use to connect to remote machines - the client.
2. **sshd** : The daemon that is running on the server and allows clients to connect to the server.

The **ssh** is pre-enabled on Linux, but in order to start **sshd** daemon, we need to install **ssh** first. Use this command to do that :

```
rashmi@laptop:~$ sudo apt-get install ssh
```

This will install ssh on our machine. If we get something similar to the following, we can think it is setup properly:

```
rashmi@laptop:~$ which ssh  
/usr/bin/ssh
```

```
rashmi@laptop:~$ which sshd  
/usr/sbin/sshd
```

Create and Setup SSH Certificates

Hadoop requires SSH access to manage its nodes, i.e. remote machines plus our local machine. For our single-node setup of Hadoop, we therefore need to configure SSH access to localhost.

So, we need to have SSH up and running on our machine and configured it to allow SSH public key authentication.

Hadoop uses SSH (to access its nodes) which would normally require the user to enter a password. However, this requirement can be eliminated by creating and setting up SSH certificates using the following commands. If asked for a filename just leave it blank and press the enter key to continue.

```
rashmi@laptop:~$ su hduser  
Password:  
  
rashmi@laptop:~$ ssh-keygen -t rsa -P ""  
Generating public/private rsa key pair.  
Enter file in which to save the key (/home/hduser/.ssh/id_rsa):  
Created directory '/home/hduser/.ssh'.  
Your identification has been saved in /home/hduser/.ssh/id_rsa.  
Your public key has been saved in /home/hduser/.ssh/id_rsa.pub.  
The key fingerprint is:  
50:6b:f3:fc:0f:32:bf:30:79:c2:41:71:26:cc:7d:e3 hduser@laptop  
The key's randomart image is:  
+--[ RSA 2048]----+  
| .00.0 |  
| . .0=. 0 |  
| . + . 0 . |  
| o = E |  
| S + |  
| . + |  
| 0 + |  
| 0 o |  
| 0.. |  
+-----+
```

```
hduser@laptop:/home/k$ cat $HOME/.ssh/id_rsa.pub >> $HOME/.ssh/authorized_keys
```

The second command adds the newly created key to the list of authorized keys so that Hadoop can use ssh without prompting for a password.

We can check if ssh works:

```
hduser@laptop:/home/k$ ssh localhost
The authenticity of host 'localhost (127.0.0.1)' can't be established.
ECDSA key fingerprint is e1:8b:a0:a5:75:ef:f4:b4:5e:a9:ed:be:64:be:5c:2f.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'localhost' (ECDSA) to the list of known hosts.
Welcome to Ubuntu 14.04.1 LTS (GNU/Linux 3.13.0-40-generic x86_64)
...
...
```

Install Hadoop

```
hduser@laptop:~$ wget http://mirrors.sonic.net/apache/hadoop/common/hadoop-2.6.3/hadoop-2.6.3.tar.gz
```

```
hduser@laptop:~$ tar xvzf hadoop-2.6.3.tar.gz
```

We want to move the Hadoop installation to the **/usr/local/hadoop** directory using the following command:

```
hduser@laptop:~/hadoop-2.6.0$ sudo mv * /usr/local/hadoop
[sudo] password for hduser:
hduser is not in the sudoers file. This incident will be reported.
```

We got:

"hduser is not in the sudoers file. This incident will be reported."

This error can be resolved by logging in as a root user, and then add **hduser** to **sudo**:

```
hduser@laptop:~/hadoop-2.6.0$ su rashmi
Password:
```

```
rashmi@laptop:/home/hduser$ sudo adduser hduser sudo
[sudo] password for rashmi:
Adding user `hduser' to group `sudo' ...
Adding user hduser to group sudo
Done.
```

Now, the **hduser** has root privilege, we can move the Hadoop installation to the **/usr/local/hadoop** directory without any problem:

```
rashmi@laptop:/home/hduser$ sudo su hduser
```

```
hduser@laptop:~/hadoop-2.6.0$ sudo mv * /usr/local/hadoop
hduser@laptop:~/hadoop-2.6.0$ sudo chown -R hduser:hadoop /usr/local/hadoop
```

Setup Configuration Files

The following files will have to be modified to complete the Hadoop setup:

1. `~/.bashrc`
2. `/usr/local/hadoop/etc/hadoop/hadoop-env.sh`
3. `/usr/local/hadoop/etc/hadoop/core-site.xml`
4. `/usr/local/hadoop/etc/hadoop/mapred-site.xml.template`
5. `/usr/local/hadoop/etc/hadoop/hdfs-site.xml`

1. `~/.bashrc`:

Before editing the `.bashrc` file in our home directory, we need to find the path where Java has been installed to set the `JAVA_HOME` environment variable using the following command:

```
hduser@laptop:~$ update-alternatives --config java
There is only one alternative in link group java (providing /usr/bin/java):
/usr/lib/jvm/java-7-openjdk-i386/jre/bin/java
Nothing to configure.
```

Now we can append the following to the end of `~/.bashrc`:

```
hduser@laptop:~$ vim ~/.bashrc

#HADOOP VARIABLES START
export JAVA_HOME=/usr/lib/jvm/java-7-openjdk-i386
export HADOOP_INSTALL=/usr/local/hadoop
export PATH=$PATH:$HADOOP_INSTALL/bin
export PATH=$PATH:$HADOOP_INSTALL/sbin
export HADOOP_MAPRED_HOME=$HADOOP_INSTALL
export HADOOP_COMMON_HOME=$HADOOP_INSTALL
export HADOOP_HDFS_HOME=$HADOOP_INSTALL
export YARN_HOME=$HADOOP_INSTALL
export HADOOP_COMMON_LIB_NATIVE_DIR=$HADOOP_INSTALL/lib/native
export HADOOP_OPTS="-Djava.library.path=$HADOOP_INSTALL/lib"
#HADOOP VARIABLES END
```

```
hduser@laptop:~$ source ~/.bashrc
```

note that the `JAVA_HOME` should be set as the path just before the '.../bin/':

```
hduser@laptop:~$ javac -version
javac 1.7.0_91

hduser@laptop:~$ which javac
/usr/bin/javac

hduser@laptop:~$ readlink -f /usr/bin/javac
/usr/lib/jvm/java-7-openjdk-i386/bin/javac
```

2. `/usr/local/hadoop/etc/hadoop/hadoop-env.sh`

We need to set `JAVA_HOME` by modifying `hadoop-env.sh` file.

```
hduser@laptop:~$ vim /usr/local/hadoop/etc/hadoop/hadoop-env.sh
```

```
export JAVA_HOME=/usr/lib/jvm/java-7-openjdk-i386
```

Adding the above statement in the **hadoop-env.sh** file ensures that the value of JAVA_HOME variable will be available to Hadoop whenever it is started up.

3. /usr/local/hadoop/etc/hadoop/**core-site.xml**:

The **/usr/local/hadoop/etc/hadoop/core-site.xml** file contains configuration properties that Hadoop uses when starting up. This file can be used to override the default settings that Hadoop starts with.

```
hduser@laptop:~$ sudo mkdir -p /app/hadoop/tmp  
hduser@laptop:~$ sudo chown hduser:hadoop /app/hadoop/tmp
```

Open the file and enter the following in between the <configuration></configuration> tag:

```
hduser@laptop:~$ vim /usr/local/hadoop/etc/hadoop/core-site.xml
```

```
<configuration>  
  <property>  
    <name>hadoop.tmp.dir</name>  
    <value>/app/hadoop/tmp</value>  
    <description>A base for other temporary directories.</description>  
  </property>  
  
  <property>  
    <name>fs.default.name</name>  
    <value>hdfs://localhost:54310</value>  
    <description>The name of the default file system. A URI whose  
    scheme and authority determine the FileSystem implementation. The  
    uri's scheme determines the config property (fs.SCHEME.impl) naming  
    the FileSystem implementation class. The uri's authority is used to  
    determine the host, port, etc. for a filesystem.</description>  
  </property>  
</configuration>
```

4. /usr/local/hadoop/etc/hadoop/**mapred-site.xml**

By default, the **/usr/local/hadoop/etc/hadoop/** folder contains **/usr/local/hadoop/etc/hadoop/mapred-site.xml.template** file which has to be renamed/copied with the name **mapred-site.xml**:

```
hduser@laptop:~$ cp /usr/local/hadoop/etc/hadoop/mapred-site.xml.template  
/usr/local/hadoop/etc/hadoop/mapred-site.xml
```

The **mapred-site.xml** file is used to specify which framework is being used for MapReduce. We need to enter the following content in between the <configuration></configuration> tag:

```
<configuration>  
  <property>  
    <name>mapred.job.tracker</name>
```

```
<value>localhost:54311</value>
<description>The host and port that the MapReduce job tracker runs
at. If "local", then jobs are run in-process as a single map
and reduce task.
</description>
</property>
</configuration>
```

5. /usr/local/hadoop/etc/hadoop/hdfs-site.xml

The /usr/local/hadoop/etc/hadoop/hdfs-site.xml file needs to be configured for each host in the cluster that is being used. It is used to specify the directories which will be used as the **namenode** and the **datanode** on that host.

Before editing this file, we need to create two directories which will contain the namenode and the datanode for this Hadoop installation. This can be done using the following commands:

```
hduser@laptop:~$ sudo mkdir -p /usr/local/hadoop_store/hdfs/namenode
hduser@laptop:~$ sudo mkdir -p /usr/local/hadoop_store/hdfs/datanode
hduser@laptop:~$ sudo chown -R hduser:hadoop /usr/local/hadoop_store
```

Open the file and enter the following content in between the <configuration></configuration> tag:

```
hduser@laptop:~$ vim /usr/local/hadoop/etc/hadoop/hdfs-site.xml
```

```
<configuration>
<property>
  <name>dfs.replication</name>
  <value>1</value>
  <description>Default block replication.
  The actual number of replications can be specified when the file is created.
  The default is used if replication is not specified in create time.
  </description>
</property>
<property>
  <name>dfs.namenode.name.dir</name>
  <value>file:/usr/local/hadoop_store/hdfs/namenode</value>
</property>
<property>
  <name>dfs.datanode.data.dir</name>
  <value>file:/usr/local/hadoop_store/hdfs/datanode</value>
</property>
</configuration>
```

Format the New Hadoop Filesystem

Now, the Hadoop file system needs to be formatted so that we can start to use it. The format command should be issued with write permission since it creates **current** directory under /usr/local/hadoop_store/hdfs/namenode folder:

```
hduser@laptop:~$ hadoop namenode -format
DEPRECATED: Use of this script to execute hdfs command is deprecated.
Instead use the hdfs command for it.
```

Hadoop 2.6.* installation

```

SHUTDOWN_MSG: Shutting down NameNode at laptop/192.168.1.1
*****/
```

Note that **hadoop namenode -format** command should be executed once before we start using Hadoop. If this command is executed again after Hadoop has been used, it'll destroy all the data on the Hadoop file system.

Starting Hadoop

Now it's time to start the newly installed single node cluster. We can use **start-all.sh** or (**start-dfs.sh** and **start-yarn.sh**)

```
rashmi@laptop:~$ cd /usr/local/hadoop/sbin
```

```
rashmi@laptop:/usr/local/hadoop/sbin$ ls
distribute-exclude.sh    start-all.cmd      stop-balancer.sh
hadoop-daemon.sh        start-all.sh       stop-dfs.cmd
hadoop-daemons.sh       start-balancer.sh  stop-dfs.sh
hdfs-config.cmd         start-dfs.cmd     stop-secure-dns.sh
hdfs-config.sh          start-dfs.sh      stop-yarn.cmd
httpfs.sh                start-secure-dns.sh stop-yarn.sh
kms.sh                  start-yarn.cmd   yarn-daemon.sh
mr-jobhistory-daemon.sh start-yarn.sh    yarn-daemons.sh
```

Hadoop 2.6.* installation

```
refresh-namenodes.sh      stop-all.cmd  
slaves.sh                stop-all.sh
```

```
rashmi@laptop:/usr/local/hadoop/sbin$ sudo su hduser
```

```
hduser@laptop:/usr/local/hadoop/sbin$ start-all.sh  
hduser@laptop:~$ start-all.sh  
This script is Deprecated. Instead use start-dfs.sh and start-yarn.sh  
15/04/18 16:43:13 WARN util.NativeCodeLoader: Unable to load native-hadoop  
library for your platform... using builtin-java classes where applicable  
Starting namenodes on [localhost]  
localhost: starting namenode, logging to /usr/local/hadoop/logs/hadoop-hduser-  
namenode-laptop.out  
localhost: starting datanode, logging to /usr/local/hadoop/logs/hadoop-hduser-  
datanode-laptop.out  
Starting secondary namenodes [0.0.0.0]  
0.0.0.0: starting secondarynamenode, logging to /usr/local/hadoop/logs/hadoop-  
hduser-secondarynamenode-laptop.out  
15/04/18 16:43:58 WARN util.NativeCodeLoader: Unable to load native-hadoop  
library for your platform... using builtin-java classes where applicable  
starting yarn daemons  
starting resourcemanager, logging to /usr/local/hadoop/logs/yarn-hduser-  
resourcemanager-laptop.out  
localhost: starting nodemanager, logging to /usr/local/hadoop/logs/yarn-hduser-  
nodemanager-laptop.out
```

We can check if it's really up and running:

```
hduser@laptop:/usr/local/hadoop/sbin$ jps  
9026 NodeManager  
7348 NameNode  
9766 Jps  
8887 ResourceManager  
7507 DataNode
```

The output means that we now have a functional instance of Hadoop running on our VPS (Virtual private server).

Another way to check is using **netstat**:

```
hduser@laptop:~$ netstat -plten | grep java  
(Not all processes could be identified, non-owned process info  
will not be shown, you would have to be root to see it all.)  
tcp        0      0 0.0.0.0:50020          0.0.0.0:*          LISTEN  
1001     1843372  10605/java  
tcp        0      0 127.0.0.1:54310        0.0.0.0:*          LISTEN  
1001     1841277  10447/java  
tcp        0      0 0.0.0.0:50090        0.0.0.0:*          LISTEN  
1001     1841130  10895/java  
tcp        0      0 0.0.0.0:50070        0.0.0.0:*          LISTEN  
1001     1840196  10447/java  
tcp        0      0 0.0.0.0:50010        0.0.0.0:*          LISTEN  
1001     1841320  10605/java  
tcp        0      0 0.0.0.0:50075        0.0.0.0:*          LISTEN  
1001     1841646  10605/java  
tcp6       0      0 :::8040             :::*              LISTEN  
1001     1845543  11383/java
```

Hadoop 2.6.* installation

```

```

Stopping Hadoop

We run **stop-all.sh** or (**stop-dfs.sh** and **stop-yarn.sh**) to stop all the daemons running on our machine:

```
hduser@laptop:/usr/local/hadoop/sbin$ stop-all.sh
This script is Deprecated. Instead use stop-dfs.sh and stop-yarn.sh
15/04/18 15:46:31 WARN util.NativeCodeLoader: Unable to load native-hadoop
library for your platform... using builtin-java classes where applicable
Stopping namenodes on [localhost]
localhost: stopping namenode
localhost: stopping datanode
Stopping secondary namenodes [0.0.0.0]
0.0.0.0: no secondarynamenode to stop
15/04/18 15:46:59 WARN util.NativeCodeLoader: Unable to load native-hadoop
library for your platform... using builtin-java classes where applicable
stopping yarn daemons
stopping resourcemanager
localhost: stopping nodemanager
no proxyserver to stop
```

Hadoop Web Interfaces

Let's start the Hadoop again and see its Web UI:

```
hduser@laptop:/usr/local/hadoop/sbin$ start-all.sh
```

Accessing HADOOP through browser

<http://localhost:50070/>

Verify all applications for cluster

<http://localhost:8088/>
